## 1.0 Introduction

This investigation report has been prepared by AECOM Technical Services, Inc. (AECOM) on behalf of Encana Oil & Gas (USA), Inc. (Encana). The purpose of this report is to summarize the results of the site investigation activities performed at the WE Lloyd #1 pit location within the Pavillion Natural Gas Field east of the town of Pavillion, Fremont County, Wyoming (see **Figure 1-1** for a site location map). The work activities completed at the pit site were outlined in the August 18, 2011 *Draft Pavillion Natural Gas Field, Fremont County, Wyoming, Field Work Plan for Site Investigations – August and September 2011* (AECOM 2011) (work plan).

The WE Lloyd #1 is a plugged and abandoned well that is believed to have had a pit on or near the current Pavillion Fee 34-3R production facility pad. There is limited historical information available for WE Lloyd #1 so the pit location was estimated based on recollections of individuals that have been in the area for many years. The WE Lloyd #1 pit location was never subject to environmental investigation because the WE Lloyd #1 well was never acquired by Encana. This site was selected for pit investigation by the Pavillion Field Working Group, Pit subgroup. The purpose of the pit investigation was to evaluate the presence or absence of impacted soil at the well site. The site also was selected because of the presumed shallow groundwater table. This report documents the investigation activities performed at the WE Lloyd #1 pit location in accordance with the field work plan.

## 2.0 Summary of Field Activities

The primary field activities conducted at WE Lloyd #1 included: utility clearance; soil boring advancement and soil sampling; temporary monitoring well installation, development, and sampling; and final field surveying of all boreholes and temporary monitoring wells.

### 2.1 Ground Disturbance Activities

In accordance with Encana's Ground Disturbance Practice, all utilities within a 100 foot radius search area were marked. All utilities within 15 feet of a proposed ground disturbance location were positively identified using air and water excavation.

### 2.2 Soil Assessment

Eight soil borings were advanced at the site using direct-push drilling technology following utility clearance. Soil borings were advanced at locations within the presumed former pit area and are shown in **Figure 2-1**. Drilling activities were performed by Inberg Miller Engineers (IME) of Riverton, Wyoming on August 30, 2011. Each soil boring was logged by a field geologist. Photoionization detector (PID) headspace readings were collected and recorded at approximately 2-foot intervals. The soil boring logs are provided in **Appendix A**.

Boring depths ranged from 12 to 16 feet below ground surface (bgs). Groundwater was encountered at depths of 10.5 to 11.5 feet bgs. The maximum PID reading from the eight borings was 30.3 parts per million at soil boring SB-5-11 (WE Lloyd #1) (11 to 12 feet bgs).

One soil sample from each boring was collected from the 0 to 1 foot bgs interval for analysis of sodium adsorption ratio (SAR). One soil sample was collected from each boring from the interval immediately above the water table for analysis of total petroleum hydrocarbons (TPH) as gasoline range organics (GRO) and diesel range organics (DRO), as required by the Wyoming Oil and Gas Conservation Commission (WOGCC). One sample also was collected from the boring with the highest PID for analysis of semi-volatile organic compounds (SVOC). The sampling and analysis conducted on each boring is provided below.

- SB-1-11 (WE Lloyd #1) – One sample was collected for TPH analysis and one sample for SAR analysis.
- SB-2-11 (WE Lloyd #1) – One sample was collected for TPH analysis and one sample for SAR analysis.
- SB-3-11 (WE Lloyd #1) – One sample was collected for TPH analysis and one sample for SAR analysis.
- SB-4-11 (WE Lloyd #1) – One sample was collected for TPH analysis and one sample for SAR analysis.
- SB-5-11 (WE Lloyd #1) – One sample was collected for TPH and SVOC analysis and one sample for SAR analysis.
- SB-6-11 (WE Lloyd #1) – One sample was collected for TPH analysis and one sample for SAR analysis.
- SB-7-11 (WE Lloyd #1) – One sample was collected for TPH analysis and one sample for SAR analysis.
- SB-8-11 (WE Lloyd #1) – One sample was collected for TPH analysis and one sample for SAR analysis.

All soil samples were submitted to Environmental Science Corporation (ESC) of Mt. Juliet, Tennessee, for laboratory analysis. Analysis of TPH-GRO and DRO was completed using U.S. Environmental Protection Agency (USEPA) Method 8015. Analysis of SVOC was completed using USEPA Method 8270. Analysis of SAR was completed using USEPA Method 6010B and the Department of Agriculture Soil Survey Method 4F. A discussion of analytical results is provided in Section 3.1.

All soil borings were surveyed by IME of Riverton, Wyoming. Soil boring locations are shown on **Figure 2-1**. All soil borings were abandoned with hydrated bentonite chips except SB-4-11 (WE Lloyd #1) and SB-5-11 (WE Lloyd #1).

### 2.3 Groundwater Assessment

Two temporary monitoring wells were installed at boring locations SB-4-11 (WE Lloyd #1) and SB-5-11 (WE Lloyd #1) on August 30, 2011. The temporary monitoring well locations are shown on **Figure 2-1**. The monitoring wells were constructed to approximately 5 feet below the water table at a depth of 16 feet. The temporary monitoring wells were constructed using 1-inch Schedule 40 PVC. The temporary monitoring wells were installed at these locations since borings SB-4-11 (WE Lloyd #1) and SB-5-11 (WE Lloyd #1) exhibited the greatest potential for groundwater impacts immediately above the water table based on PID readings and field observations. The temporary monitoring wells were developed using a hand bailer on September 1, 2011.

One groundwater sample was collected from each monitoring well on September 8, 2011. Groundwater sampling was conducted using low-flow sampling techniques. Prior to sampling, the wells were purged using a peristaltic pump and field parameters were measured. Both temporary monitoring wells were purged dry. The wells were allowed to recharge and samples were collected. Field parameters recorded during well purging included dissolved oxygen, pH, temperature, specific conductance, and oxidation reduction potential. Copies of the groundwater sampling field forms are provided in **Appendix B**. Groundwater samples were packed on ice and submitted to ESC for analysis of TPH-GRO and TPH-DRO using USEPA Method 8015; benzene, toluene, ethylbenzene, and total xylenes (BTEX) using USEPA Method 8260B; and SVOC using USEPA Method 8270C. One blind duplicate and 1 trip blank also were submitted for quality assurance/quality control purposes. A discussion of groundwater sampling results is provided in **Section 3.2**.

The temporary monitoring wells were surveyed by IME of Riverton, Wyoming, and the locations are shown in **Figure 2-1**. The temporary monitoring wells were left in place pending the WE Lloyd #1 site evaluation.

## 3.0 Analytical Sample Summary

### 3.1 Soil Sample Results

Eight soil samples were submitted for analysis of TPH-GRO and TPH-DRO. One of those also was submitted for analysis SVOC. Eight soil samples were submitted for analysis of SAR. Soil sample TPH results were compared to a TPH concentration of 1,000 milligrams per kilogram (mg/kg). This concentration represents the most stringent cleanup level identified by the WOGCC "Guideline for Closure of Unlined Production Pits". Concentrations of SVOC were compared to the residential soil cleanup level and the migration to groundwater cleanup level, both based on the Wyoming Department of Environmental Quality/Solid and Hazardous Waste Division (WDEQ/SHWD) cleanup level spreadsheet effective June 30, 2009. Analytical soil sample results are summarized in **Table 3-1** and are shown in **Figure 3-1**. A copy of the laboratory report is provided in **Appendix C**. Note that all soil samples collected at the WE Lloyd #1 site were labeled with "34-3" designation as shown on the laboratory analytical reports in **Appendix C**. These samples labeled with "34-3" correspond to the WE Lloyd #1 investigation activities and are referred to as "WE Lloyd #1" throughout this report..

TPH-DRO was detected in seven soil samples. All of the detected TPH-DRO concentrations were below the cleanup level for TPH. Certain SVOCs were detected in the soil sample SB-5-11 (WE Lloyd #1). All of the detected SVOC concentrations were below applicable cleanup levels, except naphthalene. The naphthalene detection was below the residential soil cleanup level of 3.90 mg/kg but above the migration to groundwater cleanup level of 0.00055 mg/kg. TPH-GRO was not detected in any of the soil samples collected.

#### SAR-Background Evaluation

A background evaluation of two sets of soil SAR data was conducted. One set included 12 background data points collected at locations within the Pavillion Natural Gas Field. All background data points were collected outside of well pad boundaries. The other set included 25 site data points collected from the WE Lloyd #1, Pavillion Fee 31-9, and Tribal Pavillion 21-9 well sites. This number of samples is sufficient for a valid statistical analysis. The background and site SAR data used for this evaluation is provided in **Table 3-3**. All background data was pooled into a "background" population. All site data was pooled into a "site" population. The objective of the evaluation was to determine if the "background" data and the "site" data can be considered from the same population (i.e., the site data is not unusually higher or lower than the background).

The test was run using the module for background data hypothesis testing available in the USEPA ProUCL 4.0. The tested hypothesis was that the site mean was equal to the background mean. A two-sided test was selected since SAR can be either lower or higher than the site data. The initial F-test confirms that variances were equal as shown in **Table 3-4**. This confirms the appropriate statistical test is the Two-Sample t-test assuming equal variance.

**Table 3-4** shows the output of the statistical test, Two-Sample t-test. The test shows that the hypothesis that the two populations have equal means cannot be rejected, at a confidence level of 0.95. Therefore, it is concluded that the background and site populations are not significantly different.

### 3.2 Groundwater Sample Results

Two groundwater samples were collected from the temporary monitoring wells SB-4-11 and SB-5-11, installed on August 30, 2011. The samples were analyzed for TPH-GRO and TPH-DRO, BTEX, and SVOC. Groundwater sample results were compared to the WDEQ/SHWD current cleanup levels. Analytical groundwater sample results are summarized in **Table 3-2** and are shown in **Figure 3-2**. A copy of the laboratory report is provided in **Appendix C**. Note that all groundwater samples collected at

the WE Lloyd #1 site were labeled with "34-3" designation as shown on the laboratory analytical reports in **Appendix C**. These samples labeled with "34-3" correspond to the WE Lloyd #1 investigation activities and are referred to as "WE Lloyd #1" throughout this report.

TPH-DRO was detected in the groundwater sample collected from SB-4-11 (WE Lloyd #1). The detected concentration was below the applicable cleanup level of 10 milligrams per liter. TPH-DRO was not detected in the SB-5-11 (WE Lloyd #1) sample. SVOC and BTEX were not detected in the groundwater at the site.

## 4.0 Discussion

Analytical results at the site indicate that site groundwater constituent concentrations are below applicable cleanup standards. The SAR background evaluation concluded that the background and site data are not significantly different.

Analytical results at the site indicate that site soil constituent concentrations are below all applicable cleanup levels, except naphthalene. At soil boring location SB-4-11 (WE Lloyd #1), the concentration of naphthalene was below the residential soil cleanup level and above the migration to groundwater cleanup level. Naphthalene was not detected in the SB-4-11 (WE Lloyd #1) groundwater sample. The detection limits for naphthalene in groundwater were well below cleanup standards. This indicates the potential for migration of naphthalene to groundwater is limited. No further soil or groundwater investigation is recommended at the WE Lloyd #1 pit location.

=exceeds Migration to Groundwater Cleanup Levels

=exceeds Migration to Groundwater Cleanup Levels and Residential Soil Cleanup Levels

**Bold** = detection

<sup>1</sup> Sample SB 3 11 6 8 was analyzed for SVOCs using method 8270C. Detected SVOCs are identified in the table and all other SVOCs were below detection limits (see corresponding laboratory report).

<sup>2</sup> The TPH cleanup level of 1,000 mg/kg is based on the most stringent cleanup level identified in the Wyoming Oil and Gas Conservation Commission "Guideline for Closure of Unlined Production Pits". If TPH is detected at a level greater than 1,000 mg/kg then the appropriate cleanup level will be determined based on the Oil Contaminated Soil Remediation Ranking System (OCSRRS).

<sup>3</sup> Soil cleanup levels are based on the Wyoming Department of Environmental Quality/Solid and Hazardous Waste Division (DEQ/SHWD) cleanup level spreadsheet effective June 30, 2009.

<sup>4</sup> A soil cleanup level has not been determined for SAR. Background samples were collected across the Pavillion Natural Gas Field area and will be evaluated.

GRO = gasoline range organics

mg/L = milligrams per liter

NA = not available

TPH = Total Petroleum Hydrocarbons

ND = not detected

<sup>1</sup> Samples SB-4-11 and SB-5-11 were analyzed for SVOCs using method 8270C. Detectable SVOCs in overlying soil samples are identified in the table. All SVOCs were below detection limits (see corresponding laboratory report).

<sup>2</sup> Groundwater cleanup levels are based on the Wyoming Department of Environmental Quality/Solid and Hazardous Waste Division (DEQ/SHWD) cleanup level spreadsheet effective June 30, 2009.

<sup>3</sup> This level is applicable when naphthalene and/or methylnaphthalenes are detected in groundwater at measurable concentrations.

<sup>4</sup> This level is applicable when naphthalene and/or 2-Methylnaphthalene are below MCL/DWEL concentrations in groundwater along with the other chemicals of concern AND no free product is present on the groundwater table.

Attachment A  
List of Analytes with QC Qualifiers

Sample Number	Work Group	Sample Type	Analyte	Run ID	Qualifier
L533854-02	WG553400	SAMP	TPH (GC/FID) High Fraction	R1844515	J3J5
L533854-12	WG554010	SAMP	Benzidine	R1850133	J4
L533854-20	WG553588	SAMP	Isophorone	R1845992	J4
L533854-23	WG553586	SAMP	TPH (GC/FID) High Fraction	R1844813	J6

Attachment B  
Explanation of QC Qualifier Codes

Qualifier	Meaning
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.

### Report Summary

Tuesday September 20, 2011

Report Number: L535457

Samples Received: 09/10/11

Client Project: 60196941

Description: EnCana Pavillion

The analytical results in this report are based upon information supplied by you, the client, and are for your exclusive use. If you have any questions regarding this data package, please do not hesitate to call.

Entire Report Reviewed By:

T. Alan Harvill, ESC Representative

### Laboratory Certification Numbers

A2LA - 1461-01, AIHA - 100789, AL - 40660, CA - I-2327, CT - PH-0197, FL - E87487  
GA - 923, IN - C-TN-01, KY - 90010, KYUST - 0016, NC - ENV375/DW21704, ND - R-140  
NJ - TN002, NJ NELAP - TN002, SC - 84004, TN - 2006, VA - 00109, WV - 233  
AZ - 0612, MN - 047-999-395, NY - 11742, WI - 998093910, NV - TN000032008A,  
TX - T104704245, OK-9915

Accreditation is only applicable to the test methods specified on each scope of accreditation held by ESC Lab Sciences.

Note: The use of the preparatory EPA Method 3511 is not approved or endorsed by the CA ELAP.

This report may not be reproduced, except in full, without written approval from ESC Lab Sciences. Where applicable, sampling conducted by ESC is performed per guidance provided in laboratory standard operating procedures: 060302, 060303, and 060304.

Attachment B  
Explanation of QC Qualifier Codes

Qualifier	Meaning
J2	Surrogate recovery limits have been exceeded; values are outside lower control limits
J3	The associated batch QC was outside the established quality control range for precision.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low
L2	(ESC) The associated surrogate compound falls below 10%. The data should be used with caution. A re-extraction was not possible due to limited sample volume.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.

Attachment B  
Explanation of QC Qualifier Codes

Qualifier	Meaning
J1	Surrogate recovery limits have been exceeded; values are outside upper control limits
J2	Surrogate recovery limits have been exceeded; values are outside lower control limits
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J7	Surrogate recovery limits cannot be evaluated; surrogates were diluted out

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.
